Dioxin
Dioxin

PBT (persistent, bioaccumulative, toxic) | www.toxies.com/dioxin

**LEADING ROLES**

Dioxin is a prolific bad actor -- every American gets a dose when consuming fatty foods, and as a result almost all Americans have measurable levels of this chemical in their bodies. Babies are exposed in the womb, and infants are exposed in breast milk.

Dioxin is not intentionally manufactured. A major source of dioxin is the manufacture and disposal of PVC (vinyl) plastic.

**SPECIAL SKILLS**

According to the WHO (World Health Organization), Dioxin is a carcinogen. The U.S. Department of Health and Human Services' National Toxicology Program agrees.

Dioxin also causes a wide range of non-cancer effects including reproductive, developmental, immunological, and endocrine effects in both animals and humans. Dioxins can cause developmental and immune effects at levels close to those currently found in the general population.

**PERFORMANCE REVIEWS**

A thorough review is showing Dioxin’s performances to be truly penetrating -- EPA’s draft report on Dioxin found that the cancer risk to humans from Dioxin exposure was by far the highest defined for any chemical by any government agency anywhere in the world.

Levels of Dioxin-like compounds found in the general population may cause a lifetime cancer risk that is 1,000 times higher than EPA’s generally acceptable risk level.

Analyses by the Environmental Working Group show that consuming EPA’s proposed reference dose for Dioxin over time would result in an incremental dose of the carcinogen that would be 270 times greater than what EPA considers acceptable for the general population.

**RECENT CAREER HIGHLIGHTS**

Dioxin’s infamy on the international scene is growing -- it’s been targeted for global phase out by the Stockholm Convention on Persistent Organic Pollutants, an international treaty signed by 170 nations around the world. In California, San Francisco, Oakland, and Berkeley have all passed resolutions to enact public health policies on Dioxin.

In April 2011, Edward Markey (D-MA) and 72 other members of Congress sent a letter to EPA Administrator Lisa Jackson about EPA’s dioxin report expressing concern that “EPA has missed this self imposed deadline to finalize and release the report by the end of 2010.”

In January 2011 Animal feed containing high levels of Dioxin forced the closure of more than 1,000 farms in Germany and the slaughter of at least 8,000 egg-laying chickens in Europe’s largest Dioxin food scare.

**REPRESENTING AGENTS**

Dioxin has some of the most sophisticated agents in the industry -- the chlorine-based chemical industry.

Dow Chemical, the Chlorine Chemistry Council of the American Chemistry Council, the PVC plastics industry, Georgia Pacific, and other companies and trade associations have been effectively working to delay EPA’s study on dioxin, the Dioxin Reassessment, for over 20 years.
